Startup_03 Report

React Components:

- Map component renders the individual map from Google Maps
- Calendar component renders the calendar, also from Google Calendar
- Navbar and sidebar UI components renders the Navbar and Sidebar on their own
- Template component contains the page's main structure, including CSS styles
- Folder renders the folder list for the user that contains notes, calendar events, saved map points, etc.

- Dylan contributed the calendar component
- Nils contributed the map component and also worked on the navbar and sidebar
- Antonio contributed the main template component
- Erik contributed the file explorer component

- Carefully articulates any outstanding bugs in your submission and a plan on how you intend to fix your issues.
 - You must provide this information in your document otherwise we will assume a fully functional submission and score you accordingly. You will not necessarily be penalized for a few broken pieces, however, we do expect these problems to be addressed by the next startup submission.
- Describes any product features you have decided to cut (if any)

Currently, our main issue is getting our react components to interact properly. The code is outline there, and we attempted to base our code around the work of project 6, but as it stands some components will not render with React.

Additionally, our group is using Google Maps and Google Calendar on our websites, and after speaking with TA, we were given the advice to look online for a dependency for React that will allow the Google Maps and Google Calendar widgets to render from the API.

Due to our group size dropping unexpectedly dropping from six members to four, we have had to cut a couple of features, namely our integrated grocery list. We hope to maybe return to this in the future, but for now, it is on the “maybe list”.
